AN ECOSYSTEMS APPROACH TO INNOVATION

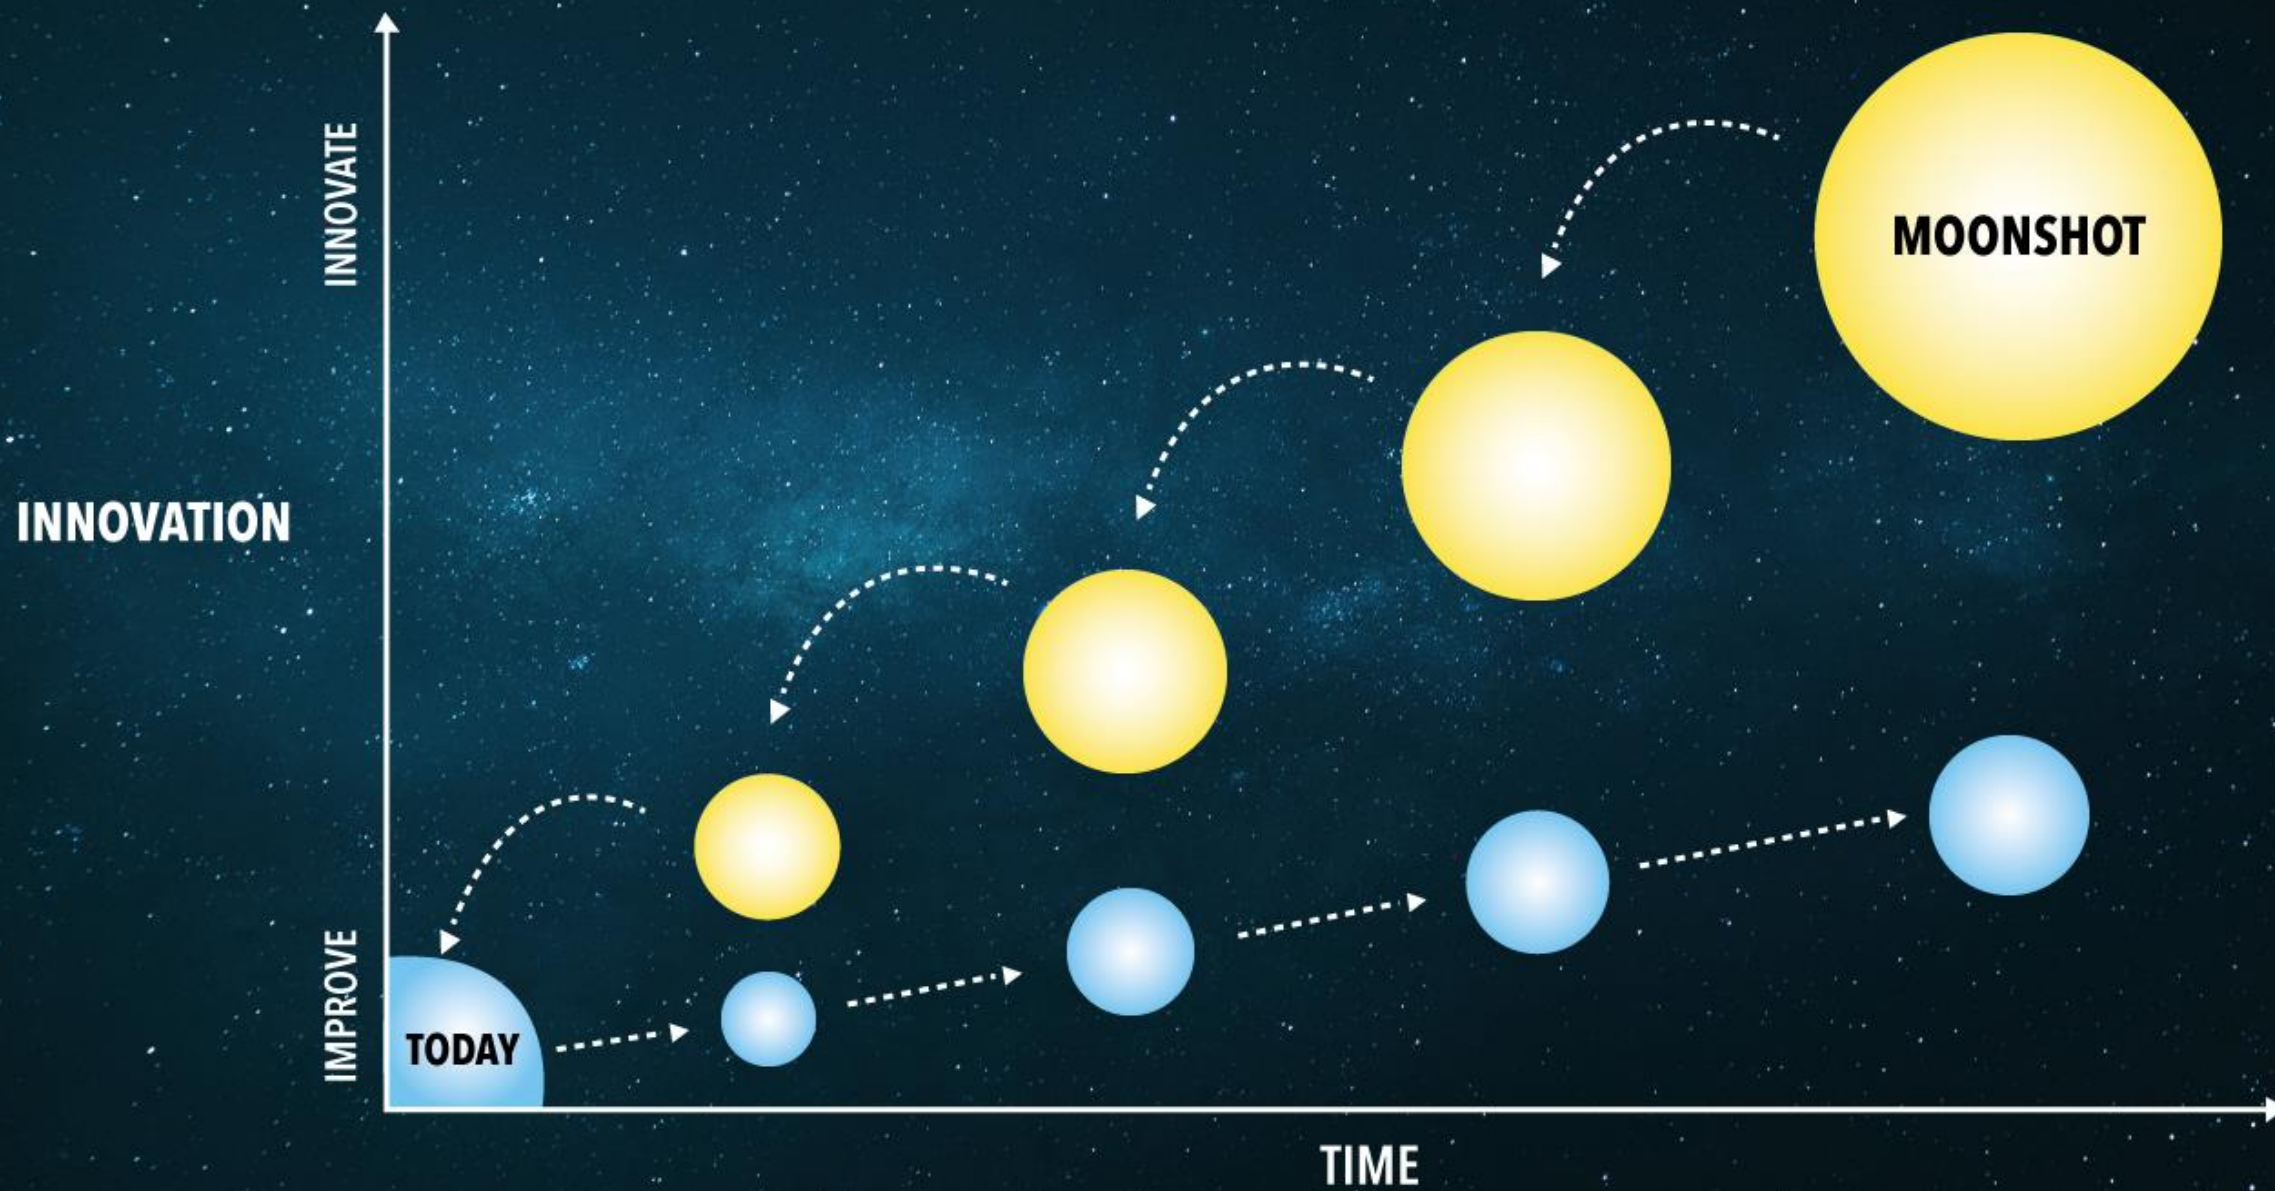

HEALTHY ECOSYSTEMS

1. The result of interaction between individual components/ people/ initiatives
2. Transformation of the current system requires overseeing the whole
3. Understand the influence of the individual components on the system
4. Shift focus to the future: what do you want to see

PILOT FATIGUE

- Altogether, 6.3 billion euros allocated for healthcare transformation across national programs
- Too much is lost in application procedures, accountability, etc
- Once pilots end, the incentive is gone and the sector reverts to old habits
- This needs to change..

MOONSHOT PROGRAM ARNHEM/NIJMEGEN

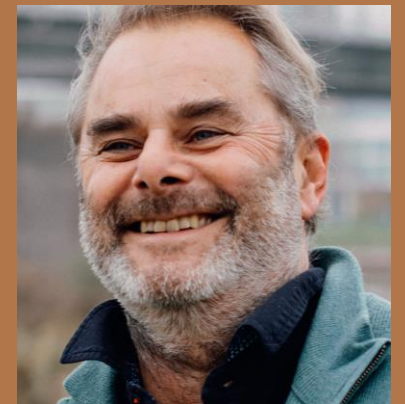

- GOAL: Developing a vibrant ecosystem where residents thrive by actively engaging with their community. Our aim is to develop a healthy living environment that reduces healthcare costs, alleviates the pressure on healthcare staff, and simultaneously promotes the well-being.
- We are forging an alliance between education, housing corporations, healthcare institutions, businesses, health insurers and local government.
- We aim for long-term sustainability by investing in technological innovations, health education, and community building.
- In our vision, aging is perceived as a continuous learning process. We promote Lifelong Learning (LLL) by organizing active engagement, stimulating the responsiveness and flexibility to address the challenges in the region, while also strengthening social bonds.
